

# First Program in Python

- hello\_python.py

- `print("learning python")`

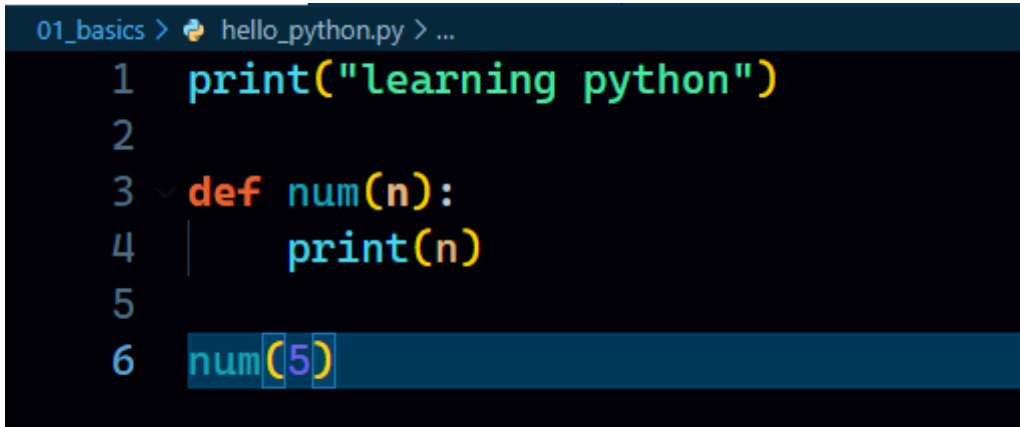

- Output after running this

- 

## An interesting thing

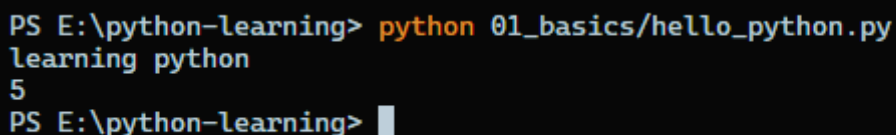

- We have created hello\_python.py .
- Now add the following code (No need to understand - just follow)

- `def num(n):`  
`print(n)`  
  
`num(5)`

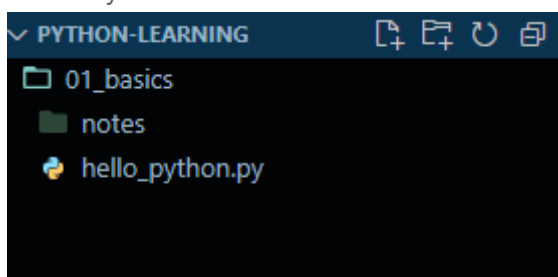

```
01_basics > hello_python.py > ...  
1 print("learning python")  
2  
3 def num(n):  
4     print(n)  
5  
6 num(5)
```

- This is just a function. Now if we run this. Output

```
PS E:\python-learning> python 01_basics/hello_python.py  
learning python  
5  
PS E:\python-learning>
```

- Directory

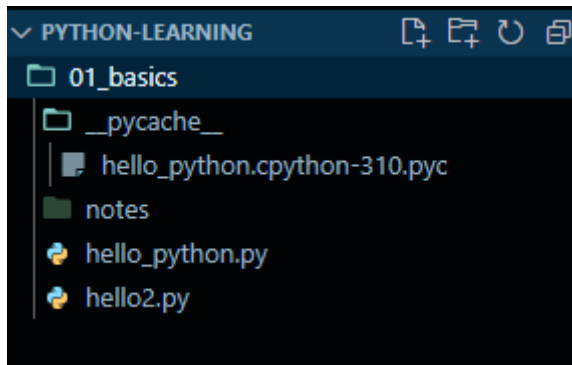

- Now we will create one more file `hello2.py` in the same directory and will call the `num` function from this file

```
01_basics > hello2.py
1  from hello_python import num
2  num(20)
```

- Now after running this file. Output

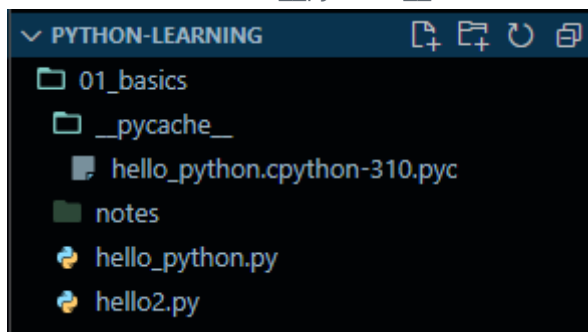

```
PS E:\python-learning> python 01_basics/hello2.py
learning python
5
20
```

- Nothing extraordinary in output
- But there will be a change in the directory.

```
▼ PYTHON-LEARNING
  01_basics
    __pycache__
    hello_python.cpython-310.pyc
    notes
    hello_python.py
    hello2.py
```

- A new folder named `__pycache__` has been created with a `.pyc` file inside it.

```
▼ PYTHON-LEARNING
  01_basics
    __pycache__
    hello_python.cpython-310.pyc
    notes
    hello_python.py
    hello2.py
```

- So this compels us to study about **Inner working of Python** which will be done next.
